

ABSTRACT

An intelligent remote caller identification system is provided that typically includes a central office, a service control point, and an internet call routing system.

The central office typically triggers a query responsive to receiving a call request.

5 The service control point is coupled to the central office, receives the query, and triggers an internet call routing query. The internet call routing system is coupled to the service control point and typically receives the internet call routing query, determines the presence of the called party with respect to a registered communication device, and sends an internet-based message to the called party at the registered
10 communication device in response to the presence determination. Methods and other systems are also provided.
